

GUIDE TO USING createSpotifyLibrary.exe

MOVE YOUR APPLE MUSIC TO SPOTIFY

First thing you want to do before you run the program is find your Spotify id and the playlist you're going to want to add your apple music to.

If you don't have a playlist in your Spotify account yet, just make one.

To get your user id go to your profile page online

Your user id is the numbers after the url link: /user/

`open.spotify.com/user/12120259561`

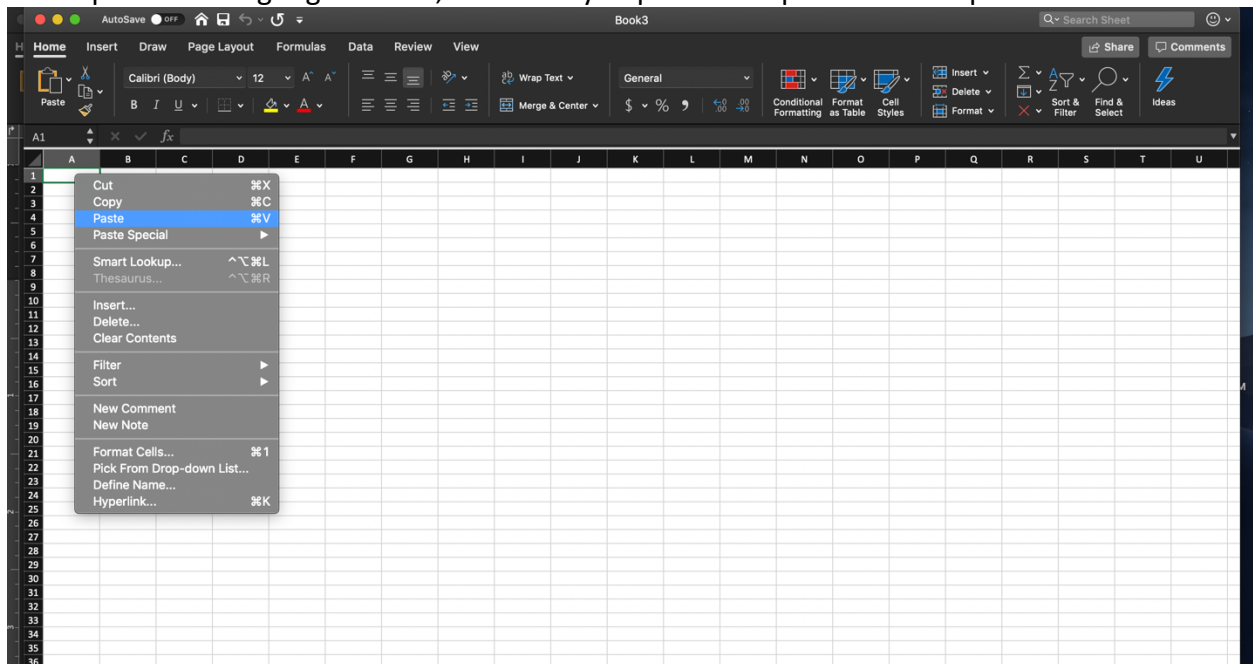

Now select the playlist you would like to add your music to.

The playlist id is the letters and numbers after /playlist/

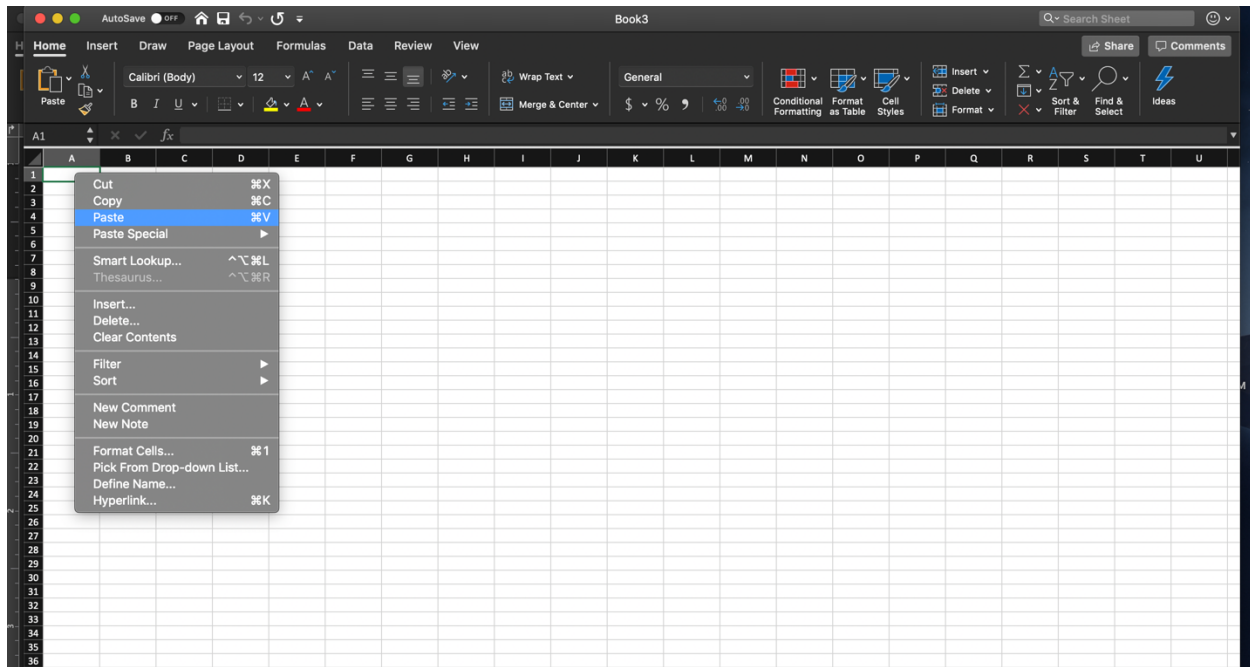

`open.spotify.com/playlist/3Wp8MOROoeQ6gBU4QEyMqT`

Save these somewhere. The program will ask you for these strings.

Now copy all of your music like so:

The end result should look like this:

Save the file as a CSV

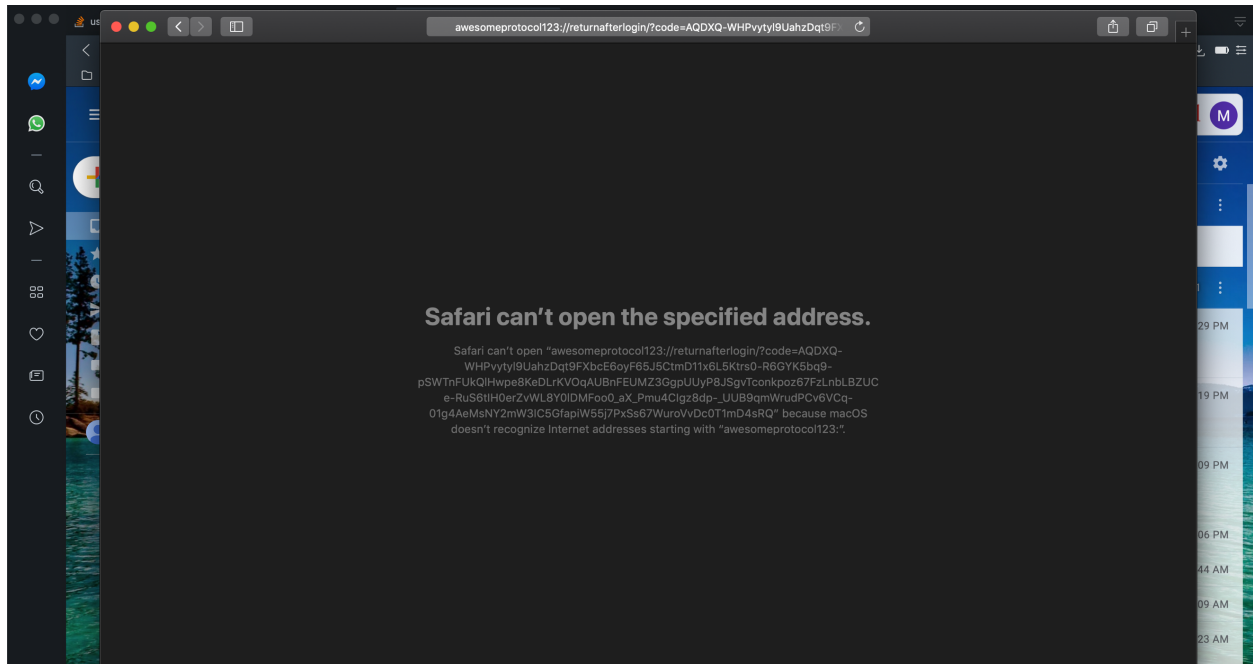

Feel free to give it whatever name you please.

Now you are ready to start the program:

Follow the instructions, fill in your user id and playlist id

The program is going launch a browser and ask you to sign into Spotify. THIS IS GOOD

When it's done it will redirect you to a nonexistent website. You need to copy that url and paste it into the console.

Windows cmd doesn't allow you to right click paste so just use CTRL-V

Press enter and that should do the trick. Now just relax and let the program do it's magic 😊
While the program is running it will print all the songs it is unable to add to Spotify and when done it will create a csv of those songs in the same respective folder that the program is in.

ENJOY!
